

INDISTINGUISHABILITY UNDER A QUERY CLASS

two DIFFERENT objects, identical under every read in the family: indistinguishable.
enlarging the family is what separates them; repeating the existing reads does nothing.

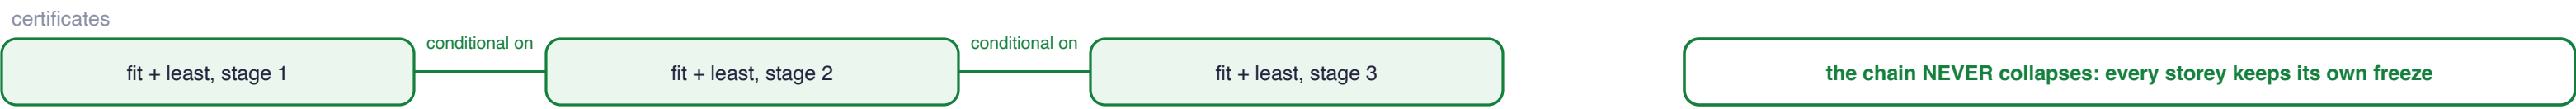

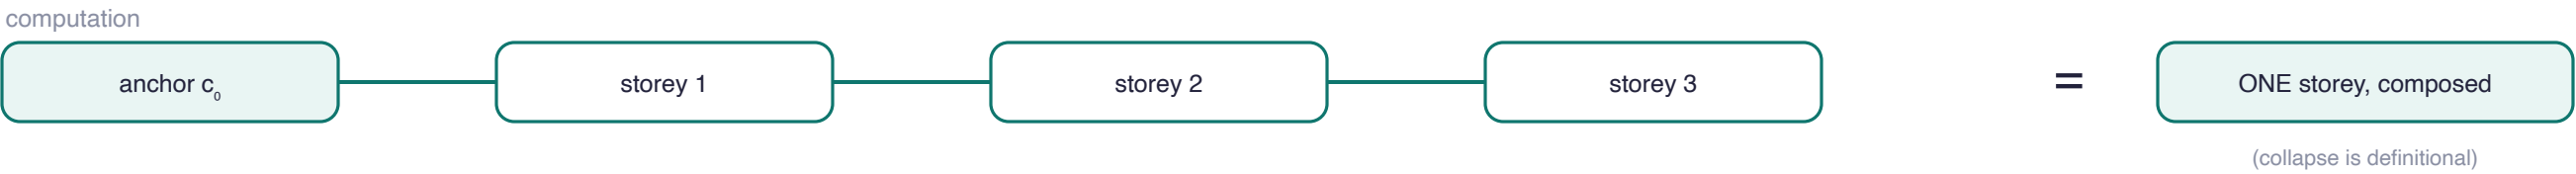

on the causal store of page three, the family is observation and the enlarging read is an intervention.

TWO-SIDED LOCATION OF LIMIT EVENTS

no single finite view decides it; a countable union of countable intersections
of finite views captures it exactly. Hardness and definability, located together.

THE COLLAPSE TEST FOR LAYERED SYSTEMS

ask of any layered system: what collapses, and what stacks. Here: the decode collapses (depth is free for computing), the certificate chain stacks (depth is real exactly for trust). The price compounds per storey.
